Static Analysis test details

Static Analysis Tool

Apps must pass Static Analysis with no Errors before they can be published to the Streaming Store.

Overview

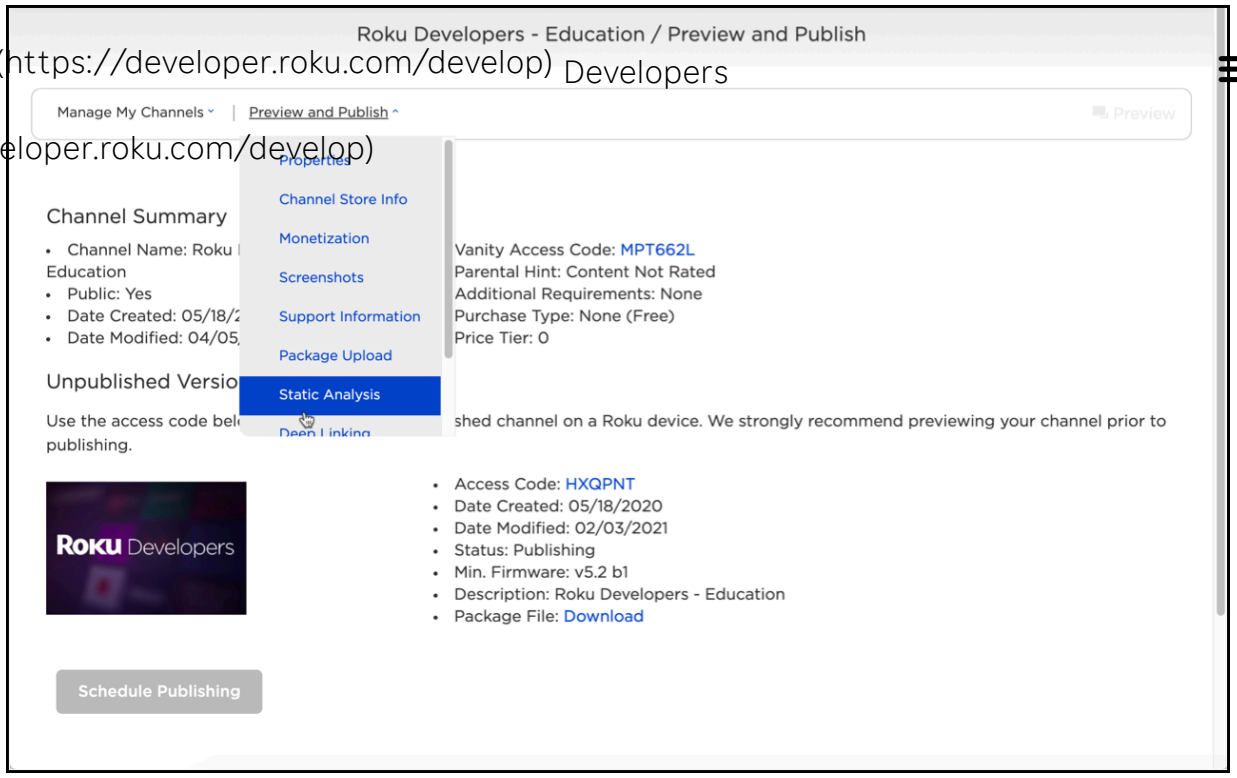
The app publishing flow includes a Static Analysis Tool used to analyze the app's BrightScript source code and detect common issues without having to submit for certification. This arms developers with the information they need to optimize their apps and ensure the app passes certification quickly. These common issues include, but are not limited to, simple app runtime issues, such as crashes on launch, and media playback errors (automated testing).

Developer Dashboard

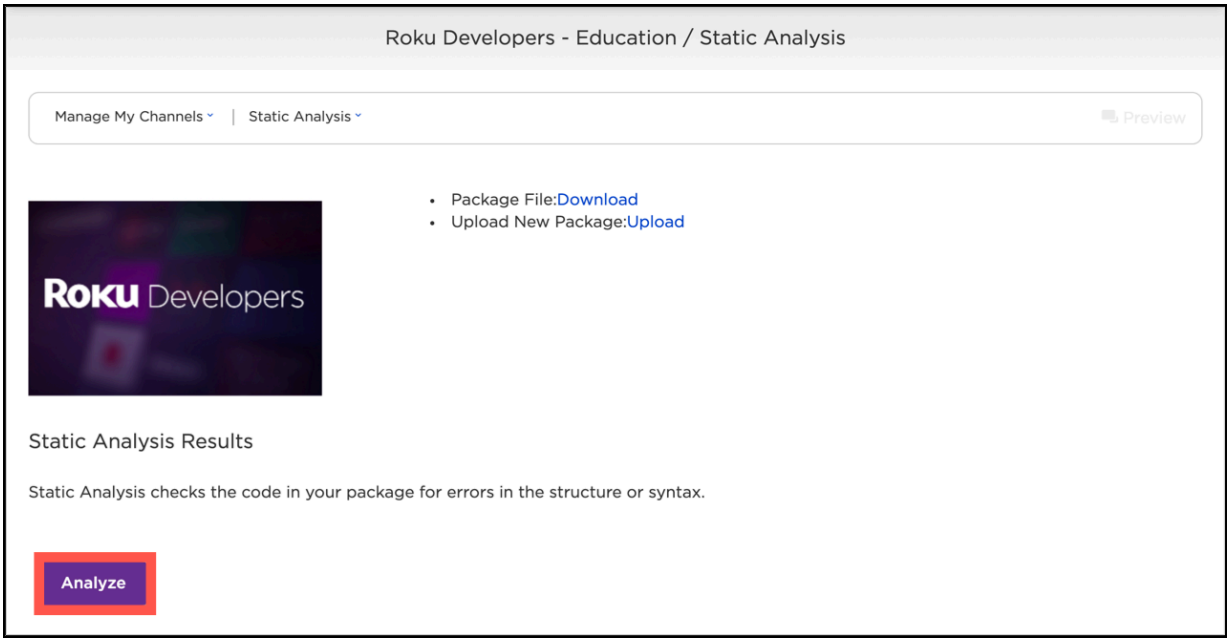
The Static Analysis Tool is available from the Developer Dashboard (https://developer.roku.com/developer).

1. From the Developer Dashboard > Manage My Channels tool, upload a package file (/docs/developer-program/publishing/channel-publishing-guide.md#package-upload-window).

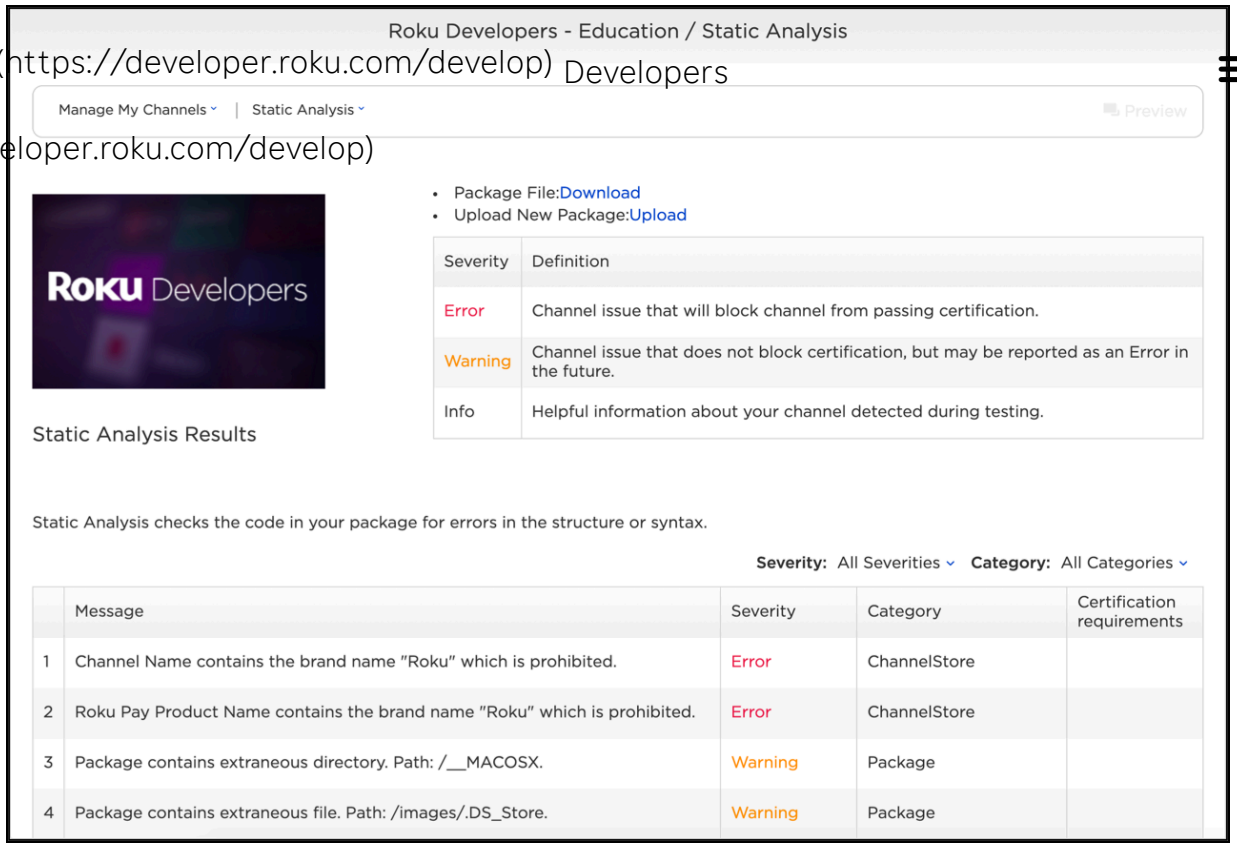
2. Select Static Analysis from the drop-down menu. This option is only available after a package file has been uploaded.



3. Click Analyze to begin the Static Analysis testing of your app. Click Refresh to check whether the Static Analysis test results are ready and display them.



4. The Static Analysis Results table lists error, warning, and info messages returned by the test. For each message, the following information is provided:



Column	Description
Message	A description of the issue related to the app.
Severity	The type of message: error, warning, or info. • Error. Errors block the app from passing certification. All errors must be resolved to pass static analysis testing and schedule the app for publishing. • Warning. Warnings do not currently block the app from passing certification; however, they should be resolved to ensure the app can pass static analysis testing in the future. In addition, resolving warnings helps optimize app performance. • Info. Info messages provide tips that may be helpful in the development of the app.
Category	The type of issue (for example, package, performance, billing, manifest, and so on).
Certification Requirement	Provides a link to any related certification requirements in the Certification Criteria (/docs/developer-program/certification/certification.md) document.

You can filter the test results based on the Severity or Category.

5. Alternatively, you can wait to receive the test results via an email notification. The test results are sent to the email address associated with the developer account. This email contains a link to the Static Analysis test results for the app (you can also download the test results as a plain text JSON file).

Static Analysis test details

Following are the tests that Static Analysis performs on the package file. More tests will be added on a monthly basis.

Test case	Date added
Manifest attributes validation	February 2018
Deprecated components detection	February 2018
Deprecated APIs detection	February 2018
Existence of required package files	February 2018
Check for UTF-8 Manifest encoding	February 2018
Extraneous directories detection	February 2018
Extraneous files detection	February 2018
Check for package size	February 2018
STOP commands detection	February 2018
RSG app identification	February 2018
Check for TimeGrid usage	February 2018
Check for roProgramGuide usage	February 2018

Test case	Date added
Proper RAF integration tests	May 2019
Proper Roku Pay integration tests	May 2019
Proper RED integration tests	May 2019
Proper Automatic Account Link integration	May 2019
Proper Deep Linking integration	May 2019
Proper General Audience Measurements integration	May 2019
Application nesting tests	May 2019
App/screensaver entry point detection	May 2019
Manifest libs detection	May 2019
Eval usage	May 2019
App name in manifest is different from metadata in Streaming Store	May 2019
App version in manifest is different from metadata in Streaming Store	May 2019
App version was updated for submitted package	May 2019
Developer ID of submitted package matches Developer ID of previously-submitted package	May 2019
Roku Pay usage was found in BrightScript code but was not specified during app publishing	May 2019
Roku Pay usage was specified during app publishing but was not found in BrightScript code	May 2019
Ads revenue usage was specified during app publishing but RAF was not found in BrightScript code	May 2019
RAF usage was found in BrightScript code but ads revenue was not specified during app publishing	May 2019
Proper Server-Side Ad Insertion (SSAI) RAF integration.	May 2019
Check whether contentId and mediaType parameters in deep link requests are being handled.	May 2019
Check for the supports_input_launch attribute in the manifest (required for handling deep link requests while your app is running)	May 2019

Roku (https://developer.roku.com/develop) Developers
(https://developer.roku.com/develop)

Test case	Date added
Check whether the setAdUrl() method is called in RAF implementations, and whether the ad server URL is specified in the method.	June 2019
Check for usage of deprecated methods: • roDeviceInfo.GetVideoDecodeInfo() • roDeviceInfo.GetAudioDecodeInfo() • roDeviceInfo.isHDMIConnected() • roDeviceInfo.GetConnectionInfo()	February 2020
Check for usage of deprecated content metadata attribute: AudioLanguageSelected	February 2020
Check app type (for example, SDK, screensaver, and so on).	February 2020
Deprecated rsg_version (older than 1.2) detection	March 2020
ECP or roAppManager command detection	March 2020
Check for missing entry point ("sub RunUserInterface(args as Object)" or "sub Main()" for apps; "sub RunScreenSaver(args as Object)" for screensavers).	April 2020
Check for Roku Pay upgrade/downgrade implementation	May 2020
Check that apps using SGDEX have implemented Billing and RAF	September 2020
Check for components that cannot be used in a screensaver	July 2020
Remind apps with RAF implementation to pass kidsContent flag in calls to setContentGenre() method.	September 2020
Check whether apps are firing AppDialog signal beacons from log-in or user selection dialogs.	September 2020
Check for "Roku" within app name or names of in-app products, including names with localized characters	November 2020
Check for usage of roAppManager.LaunchApp() function, which is prohibited	December 2020
Check that SGDEX billing apps have implemented upgrade/downgrade	December 2020
Extraneous packages file detection.	December 2020

Test case	Date added
Third-party oAuth provider detection	January 2021
Third-party ad library detection	January 2021
Check for deprecated Adobe and Verimatrix DRMs	March 2021
Check for usage of deprecated roDeviceInfo.getVersion() function.	March 2021
Check for usage of deprecated Video node manifestData fields: mpd and periods	March 2021
Check for file:// protocol usage from roUrlTransfer	April 2021
Check for Roku brand name in Roku Pay in-app product descriptions	May 2021
Check for getUserData API (RFI screen) in apps with authentication	September 2021
Check for SetChannelCredData() and GetChannelCred() APIs in apps with authentication	September 2021
Check for Voice Keyboard APIs in apps with authentication	September 2021
Check for in-app screensavers (or any feature that overrides Roku system screensaver)	November 2021
Check if app is a Theme	April 2023
For apps in the U.S. Streaming Store meeting the streaming hours threshold (average of 5 million hours per month over the last three months), check that apps have implemented Continue Watching	July 2023
Check app source code for nested libraries	July 2023
Check for deprecated run_as_process manifest entry	November 2023
Check that SVOD apps have product groups for all sets of mutually exclusive subscription products	February 2024
Check if app is using roAppMemoryMonitor node to track prior exit information	February 2024
